
ContentBox

A Content Revolution

What is ContentBox?

ContentBox is a free professional open source modular content management engine that allows you to easily build websites, blogs, wikis, web applications and even power mobile or cloud applications. Built with a secure and flexible modular core, designed to scale, and combined with world-class support, ContentBox will get your projects out the door in no time.

Solid Foundation Built To Scale

ContentBox is built with a solid professional open source MVC framework foundation; The ColdBox Platform, which has been powering web applications since 2005 and used by thousands of developers worldwide. Used by clients like NASA JPL, ESRI, Adobe TV, IDG, State of Oregon, US Air Force, State of Las Vegas, NASA Kennedy Space Center, Equator Financial, FAA, AIIC, General Electric, and many more.

Under the hood ContentBox is powered by a Java based engine and written using an object oriented content model via Hibernate, the de-facto standard object relational mapper. ContentBox can be deployed in almost any Java container and our entire infrastructure is built with scalability, clustering and cloud deployment in mind.

COLDBOX

Modularity is Key!

ContentBox is not a traditional and monolithic CMS, blog or wiki application, but a combination of software modules that will provide you with CMS, blog and wiki capabilities. ContentBox can also enhance any ColdBox application with content capabilities without affecting the parent application. You can also use ContentBox as a content value store and serve content via its RESTful API. No longer be restricted by a monolithic application's extension points, but extend and scale modularly.

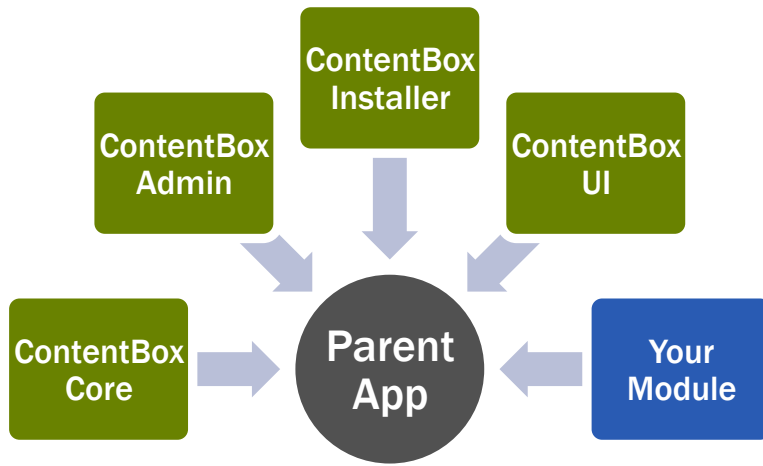

CONTENTBOX

Developer Features

- Modular MVC Architecture
- Extend via event driven programming with over 100 different events
- Dependency injection and AOP foundations
- Create custom content types
- Pluggable custom security mechanisms
- Pluggable custom search engine mechanisms
